FN ISI Export Format VR 1.0 FT J AU Balladares, E Gonzales, A Para, R Sanchez, M TI Fring arsenic contained in a gas phase using solid hematite SO REVISTA DE METALURCHA AB Feasibility to obtain femic arsenate starting from arsenic containing gas in contact with Fe2O3 has been studied. Themodynamic stability of the system Fe-As-O was analyse order to verify conditions to form FerAsyOc type compounds. Experiments were made using a hematite sample suspended in a thermogravimetric device. As+OO was general starting from solid As203 which was circulating through the iron oxide. Final samples were analysed chemically and by means of DEX, verifying the formation of FeAsO4, FeAsO4(H2O)(i) is small quantities. Tests in provus bed and pellets were carried out, studying the effect of: porosity, temperature and oxygen potential largest conversion obtained was 10 % at 800 degreesC, pO(2) = 50 % and porosity = 0.883.
